1. Room Control System

This section describes the core user interface and control components installed in a guest room environment.

It includes both corridor and in-room panels, which together form a unified system for guest interaction, access control, and room management.

The corridor panel provides room identification, access functionality, and communication with guests, while the room panel enables control of comfort settings such as HVAC, lighting, and service functions.

Together, these components create a seamless and intuitive user experience, while also supporting operational processes such as housekeeping, access management, and energy efficiency.
