CyBroUpdate

A program for simplified upgrading of multiple controllers at the same time. The application runs in a Windows environment on a local network.

The upgrade definition is in the ini file. For a more detailed description of the ini file, see the comments in the ini file.

Upgrade steps for each controller: - backup of all retentive variables, basic backup verification - program loading - restore retentive variables from backup (controller paused when restored) - start controller

The program uses the following external programs: - CyBroComServer.exe - CyPro.exe
